

C SHAPES/STANDARD CHANNEL

STOCK LENGTHS: 20', 30', 40', 60' ASTMA-36

The AISC criteria that governs the method of determining the Approximate Dimensions for Detailing S, C and MC shapes is as follows:

d, depth of section, rounded to the nearest $\frac{1}{8}$ "

b_f, width of flange, rounded to the nearest $\frac{1}{8}$ "

t_f, average flange thickness, rounded to the nearest $\frac{1}{16}$ "

t_w, web thickness, rounded to the nearest $\frac{1}{16}$ "

t_w/2, one half the decimal thickness of the web, rounded to the nearest $\frac{1}{16}$ " (note that this derivation and rounding differs from that of W and HP shapes)

a, projection of the flange beyond the face of the web = $\frac{1}{2}$ " (decimal flange width minus decimal web thickness), rounded to the nearest $\frac{1}{8}$ "

T, clear distance on web between fillets, = (decimal depth of shape

minus ASTM A6 maximum under tolerance) minus 2 (decimal flange thickness at heel plus decimal fillet radius x tangent $\frac{1}{2}$ (90 - θ)), where θ is the flange slope, rounded down to the nearest $\frac{1}{8}$ "

k, distance from the outside of the flange to the fillet on the web, = $\frac{1}{2}$ (fractional depth of the shape minus fractional value of T), which will automatically be rounded up to the nearest $\frac{1}{16}$ " because of the rounding of T

Except for **k**, fractional dimensions such as "a" are derived by first using the theoretical decimal dimensions to calculate their value, then rounding the results to a fractional value. The rounding off of decimal dimensions to fractions can lead to an accumulation of differences when these fractions are added. For examples, S shapes fractional values of $2a + t_w$ may not equal their fractional value of **b_f**.
